Rottler’s HP6A honing machine uses pushbutton controls and a digital cylinder profile LED display. It can hone large blocks or single cylinders, and can dwell anywhere in the cylinder to work out tight spots without raising or lowering the workpiece.

Rottler’s new F-67A is fully programmable and moves from bore to bore automatically. It saves all settings in memory for instant recall. Its multi-purpose capabilities include boring, surfacing, line boring, reaming, etc. Its variable feeds and speeds allows for surface finishes as low as 10 Ra.
